

Practicing Carbon Neutrality with Your Children, Let's Protect the Earth

Are you aware that abnormal weather phenomena are occurring in various regions of the world as the Earth's average temperature rises? Furthermore, in Korea, spring and autumn have become shorter over time, preventing us from fully experiencing the four seasons. We are also hearing news of damages such as air pollution, droughts, and floods occurring in many countries due to extreme weather events caused by greenhouse gases emitted from all over the globe. Additionally, fine dust and yellow dust are threatening the health of our children with various diseases such as atopic dermatitis and asthma. We are providing the following guidelines on practical ways to achieve carbon neutrality with your children. Please refer to them and join us in protecting the environment to safeguard our children's future.

Q. What is carbon neutrality?

Carbon neutrality means making the actual emission "zero" by taking measures to absorb carbon dioxide as much as the emission of carbon dioxide. In other words, the actual CO2 emissions are zero.

Q. Why we must achieve carbon neutrality?

The biggest reason we must achieve carbon neutrality is 'climate change'. This is because global warming is occurring due to the increase in carbon dioxide emitted from refrigerators, cars, and factories, and this is also causing socioeconomic problems such as heavy rainfall, droughts, and increase in new diseases, and coastal erosion.

Q. Let's put this into practice together.

Separate and recycle every day

Water the grass and flowers around you.

Walk when going short distance.

Plant a tree with Mom and Dad.

Plogging (Pick up trash.)

Trading toys with a friend is also a good idea!
